

Faster reimbursement review. Human-owned decisions.

Turn the receipts from one business trip into one reviewable, explainable approval—and an accountant-ready handoff.

Evidence organized. Authority retained.

The screenshot displays a web application interface for reviewing receipts. On the left, two synthetic receipts are shown: 'Synthetic Airport Taxi' and 'Synthetic City Rail', each with a date of 15/09/2026 and a grand total of INR 250.00 and INR 750.00 respectively. On the right, a detailed view of 'Receipt 2' is shown, including the merchant 'Synthetic Airport Taxi', the amount '250', and the incurred date '15/09/2026'. Below this, 'Receipt 3' is also visible with merchant 'Synthetic City Rail' and amount '750'. At the bottom, a 'Report total' of ₹3,250.00 is displayed. A green button at the bottom center reads 'Submit 3 receipts for one assessment →'.

A single report with verified, line-level receipt evidence.

Reimbursement review is an evidence-reconstruction job.

Qualitative discovery indicates reviewers and submitters repeatedly reconnect receipts, policy context, and decision history.

Receipts live apart

Reviewers download, search for, or request receipt evidence across tools.

Policy context is detached

The rule, its evidence, and the decision are not always visible in one review surface.

Missing evidence restarts work

A missing receipt can trigger avoidable back-and-forth instead of continuing the same case.

What this evidence does not prove

It does not establish quantified time savings, willingness to pay, or market size. Those are the next discovery gates.

Automate evidence assembly—not financial authority.

ClearSpend separates reproducible policy checks, bounded AI assistance, and the human decision.

1 Deterministic checks

Receipt, policy, amount, date, and matching checks run first.

2 Bounded AI advice

AI only helps with unresolved ambiguity. It cannot approve, export, or move money.

3 Human decision

A finance reviewer approves, rejects, or requests information and owns the final state.

Design boundary: ClearSpend is decision support for reimbursement review, not autonomous approval or payment execution.

Submit one trip—not disconnected receipts.

Employees select one shared category and purpose, upload up to 20 receipts, then verify extracted details line by line.

The screenshot shows a web browser window with the URL 'localhost:3000'. The page has a header with the text 'From receipt to books, clear and accountable.' and a sub-header 'Receipt extraction, deterministic policy checks, bounded AI assistance, human authority, and an accountant-ready handoff.' A dark green badge in the top right corner says 'System operational' and '6 awaiting review'. The main form is titled 'EXPENSE REPORT' and 'Submit one trip as one approval'. It has a progress bar at the top right: '1 Scan - 2 Verify each line - 3 Submit'. The form includes an 'Upload up to 20 receipts' section with a file upload button and a 'Choose files' button. Below this, it says 'No clean receipts added yet.' There are two input fields: 'Shared category' with a dropdown menu showing 'travel' and 'Report total' with a value of '₹0.00'. There is also a 'Business purpose' field with the text 'Bangalore client visit'. At the bottom, there is a green button that says 'Submit 0 receipts for one assessment'.

1. Upload a same-category receipt bundle

Receipt bytes are quarantined, malware-scanned, and then parsed; extraction is proposed evidence, not silent truth.

The screenshot shows the same web browser window, but now the 'Verify' step is active. The progress bar at the top right shows '1 Scan - 2 Verify each line - 3 Submit'. The form is titled 'EXPENSE REPORT' and 'Submit one trip as one approval'. It has a section 'Upload up to 20 receipts' with a file upload button and a 'Choose files' button. Below this, there are two receipt cards. Each card shows a receipt image on the left and extracted details on the right. The first receipt is for 'Synthetic Conference Hotel' with a merchant name 'Synthetic Conference Hotel', an amount of '2250', and an incurred date of '15/09/2026'. The second receipt is for 'Synthetic Airport Taxi' with a merchant name 'Synthetic Airport Taxi', an amount of '250', and an incurred date of '15/09/2026'. Each receipt card has a 'Remove' button in the top right corner.

2. Confirm merchant, date, and amount

One approval boundary. Line-level proof.

The server derives the aggregate total; every receipt remains individually visible and checked.

localhost:3000

Work Finish update

Receipt 2 Remove

Taxi_Receipt.pdf · scan clean · encrypted storage

Merchant: Synthetic Airport Taxi Amount (INR): 250

Incurred date: 15/09/2026

Receipt 3 Remove

Train_Receipt.pdf · scan clean · encrypted storage

Merchant: Synthetic City Rail Amount (INR): 750

Incurred date: 15/09/2026

Shared category: travel Report total: ₹3,250.00

Business purpose: Bangalore client visit

Submit 3 receipts for one assessment -->

One report

Up to 20 same-category receipt lines become one reviewable case.

No silent rewrite

New evidence is appended; prior receipt revisions remain inspectable.

Derived total

The client cannot assert a different aggregate than its verified lines.

A recommendation is visible—but never the decision.

Reviewers see deterministic evidence, cited policy, and bounded AI advice before taking a human action.

Checks and citations

A request for information keeps the case open so the employee can append the missing evidence rather than restart the report.

Approve, reject, or request information

Accounting handoff with a traceable record.

ClearSpend produces an accountant-ready CSV only after a reviewer confirms coding; it does not execute payment.

Human-confirmed coding and line-level CSV

Operating signals and hash-linked audit events

"Exported" means CSV generated—not ERP acceptance, reimbursement payment, or book close.

Controls make the workflow inspectable; they do not turn this into a production payments platform.

Implemented for the synthetic MVP

Encrypted quarantine and fail-closed malware scan before parsing

Receipt evidence revisions, policy pinning, deterministic-first checks

Reviewer-owned decisions, CSV export record, hash-linked audit trail

Explicit boundary and next gate

No banking, card, payment, or ERP connection

Demo identities are not production authentication; live use needs OIDC/MFA and hardened access controls

Customer validation, OCR accuracy, and live-model quality remain unproven

Discovery boundary: use only synthetic or customer-created de-identified cases until the required pilot security controls are accepted.

A focused workflow for INR-only, multi-receipt reimbursement review.

Initial hypothesis: India-based finance teams still managing receipt-based claims through email, spreadsheets, tickets, or generic expense forms.

Current workaround

Evidence distributed across inboxes, attachments, spreadsheets, tickets, and policy documents.

ClearSpend wedge

A human-reviewed evidence packet with policy context, decision trace, and CSV handoff.

What it does not replace

ERP, payment, AP, procurement, cards, or an organization's complete approval hierarchy.

Positioning

Start with the narrow task of reaching a defensible reimbursement decision—not a claim to be a full finance platform.

Paid discovery before scale.

The commercial package and customer-value claims remain hypotheses until the precommitted tests are run.

PAID DESIGN-PARTNER PILOT

INR 25,000

Paid in advance • 30 calendar days • one organization • up to 10 active reviewers

Includes configured reimbursement-policy workflow and CSV accounting handoff.

Excludes custom ERP integration, payment execution, SSO, and production-security commitments beyond MVP scope.

Engineering evidence

A reproducible synthetic workflow, controls, and risk-path verification.

Qualitative evidence

Five consent-safe interview summaries; direct product feedback is limited.

Validation still required

Measured reviewer behavior, decision quality, and paid commitments.

No free pilot, verbal interest, or non-binding LOI counts as willingness to pay.

Validate the wedge before broadening the product.

Feature expansion follows demonstrated workflow value, safety, and paid commitment—not a finance-platform wish list.

NOW

Observe five contextual reviews and run counterbalanced usability tasks. Gate: $\geq 20\%$ lower median active review time, no error increase.

NEXT

Offer the same paid pilot to five qualified buyers. Gate: ≥ 2 paid commitments; complete pilot access and data-readiness controls.

LATER

Harden the proven workflow, then add one requested integration or variant only when evidence makes it the adoption constraint.

THE ASK

Introduce us to finance reviewers and economic buyers willing to test a de-identified reimbursement-review workflow—and, if the evidence clears, become paid design partners.
